

Today's Closet

Mobile Companion App That Displays Outfits Instead of Numbers

Instead of having to figure out what to wear based on the weather, the app displays suggested outfits for you to wear. Overtime it learns to adjust to your preferences in different situations such as how long you're outside, what mode of transport you'll be taking, where you are, if you're sick or not, if it's precipitating, etc.

Product Name: Today's Closet

What it is for: Suggests appropriate outfits and gear to wear/bring for whatever outdoor activity you plan to pursue. This is to help people dress up properly for the weather.

What data it collects: It collects outdoor temperature, windspeed, humidity and precipitation as well as personal body temperature to determine what you should be wearing. The outdoor weather data it collects depends on where you are and where you plan on going.

How the data is stored: Data will be stored on whatever cloud service you select under settings.

How the data is visualized and why: Data is visualized through suggested outfits as well as temperature colour bars. This is so that weather data can be translated to the day-to-day need of determining what clothes should be worn without having to deal with numbers. The temperature colour bars is not for outdoor temperature but rather how you felt with the day's outfits so it can help the app can adjust to your personal preference as well as show you how accurate the app was and what outfits you wore during similar weather days.
